How a recording becomes study notes (1/2)

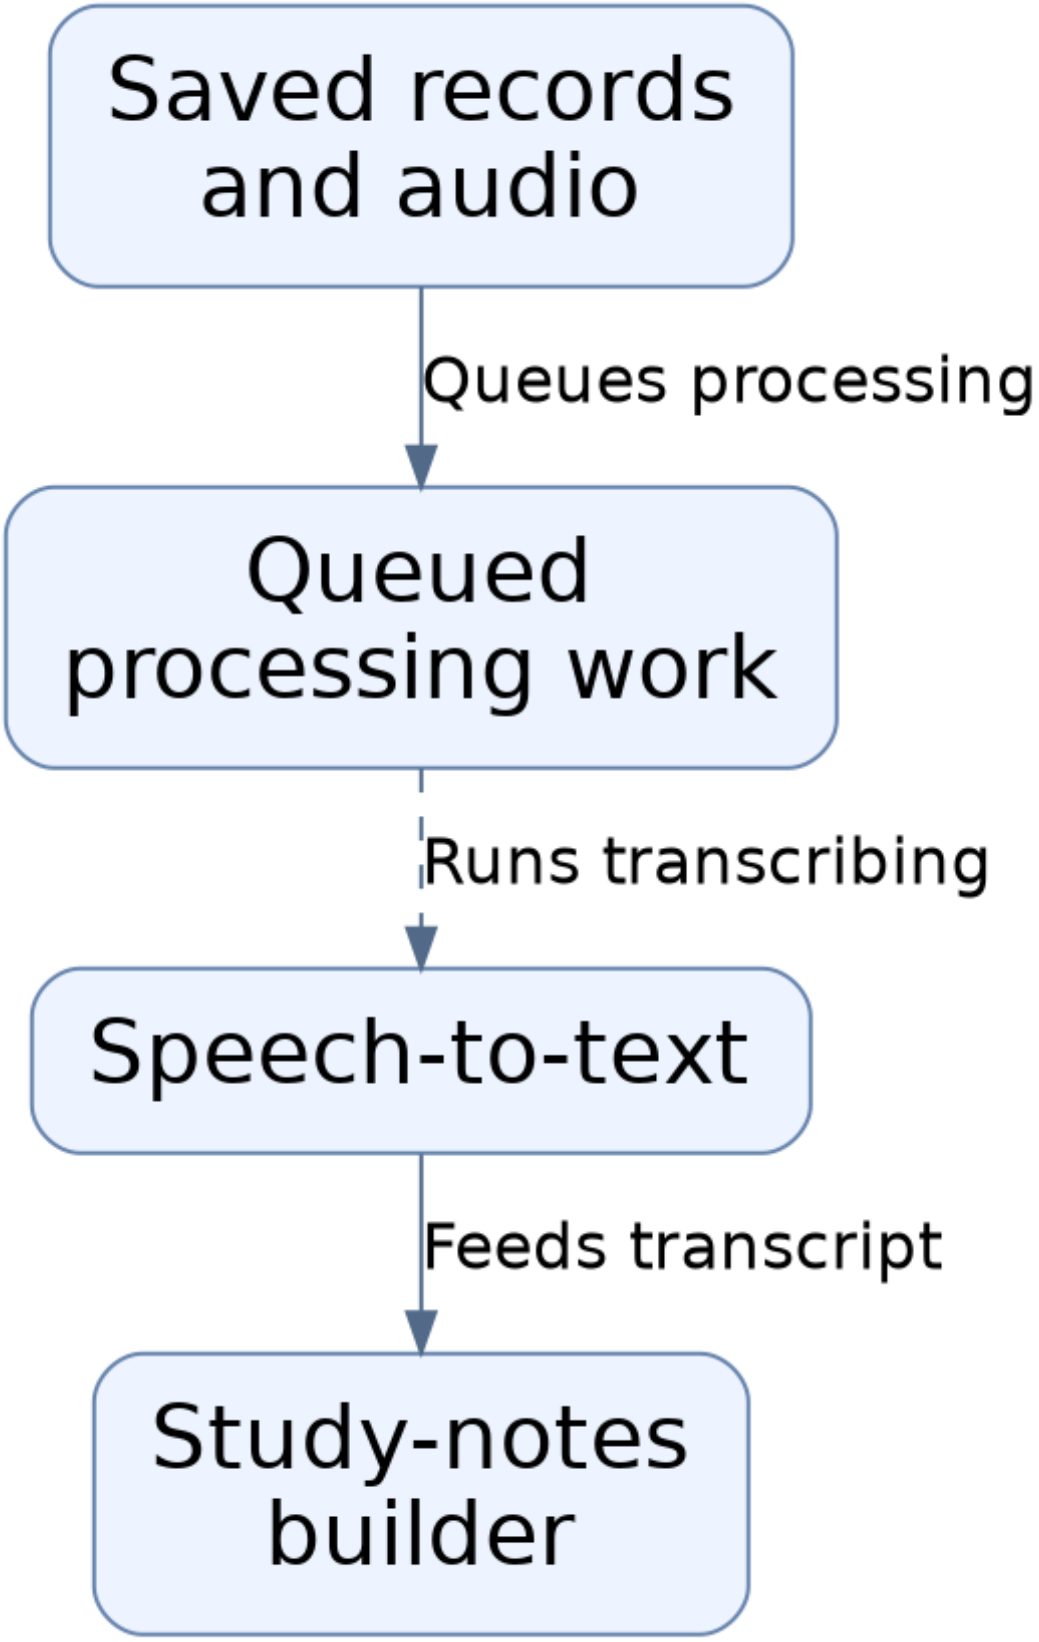

A local client asks the API to create a meeting and send audio; the system verifies the request is local, checks and stores the audio, queues a job, transcribes it, and builds structured study notes.

How a recording becomes study notes (2/2)

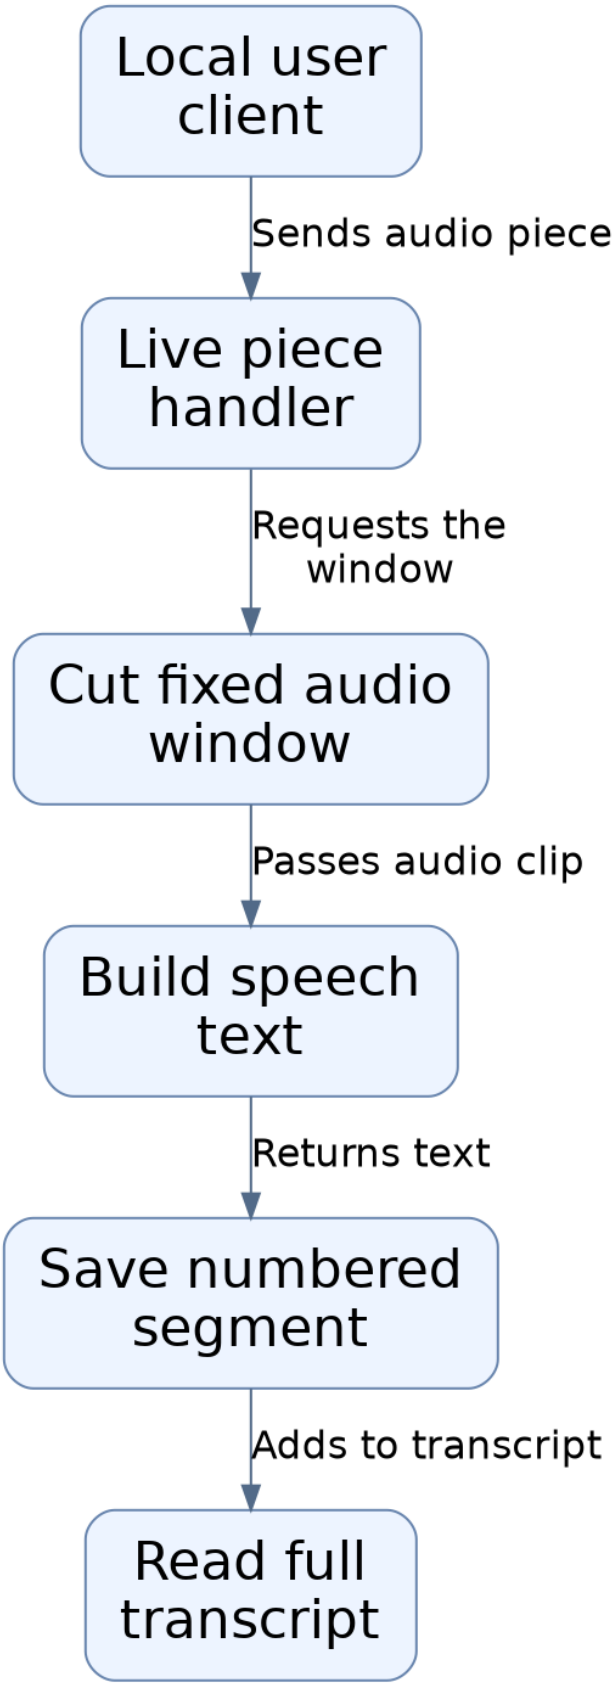

A local client asks the API to create a meeting and send audio; the system verifies the request is local, checks and stores the audio, queues a job, transcribes it, and builds structured study notes.

Dashed arrows: connections that need confirmation.

Live audio arriving in pieces

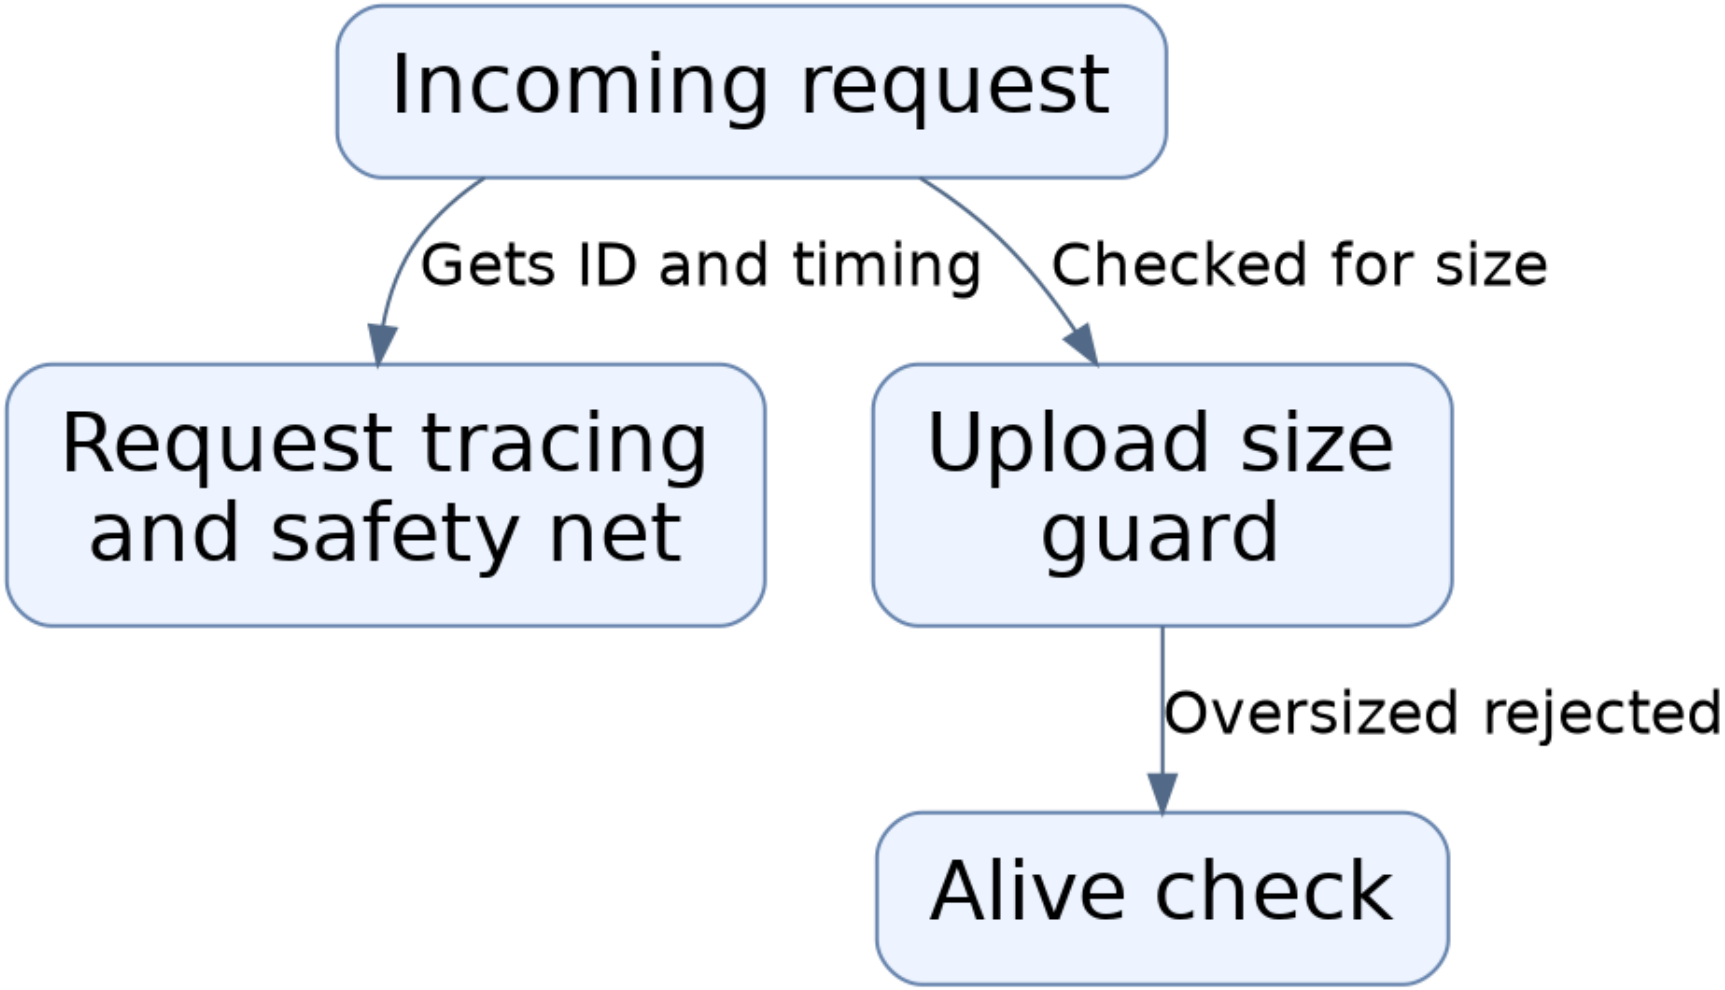

A local client sends numbered audio pieces during an ongoing recording; the system cuts a fixed window, transcribes it, stores the text under that number, and can return the full transcript so far.

Keeping the service healthy and watched (1/2)

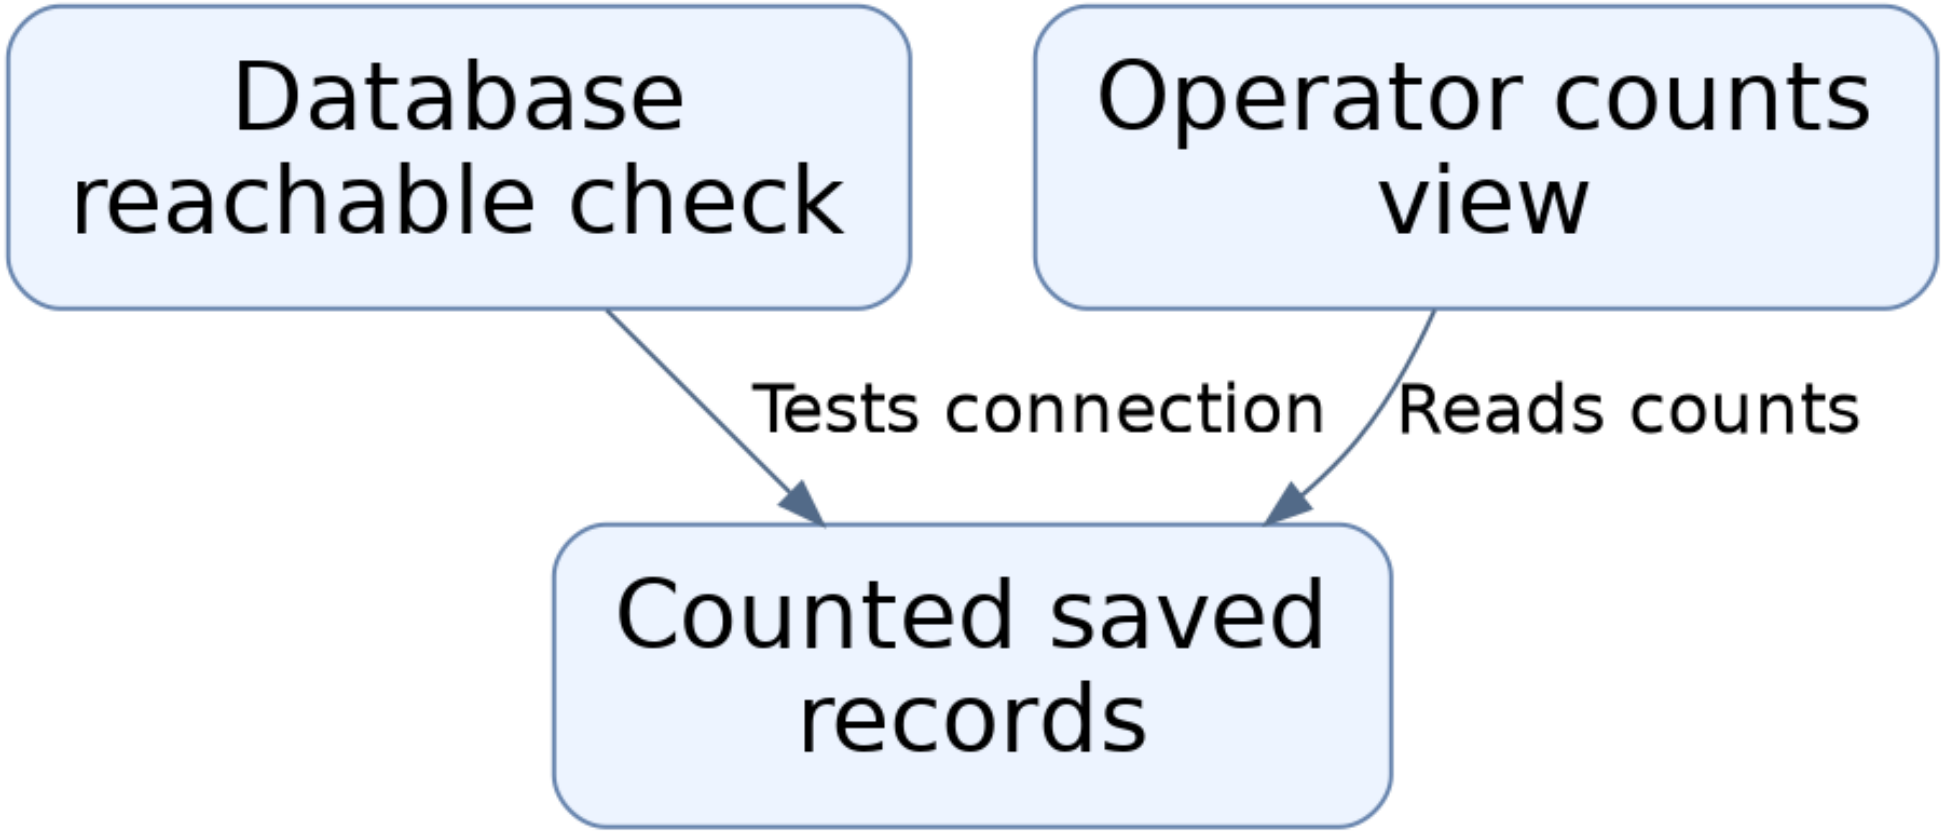

Each incoming request gets a tracking ID, timing, and a log line; oversized uploads are cut off early; small endpoints report liveness, database reachability, and counts of queued or overdue records for operators.
