How a meeting's notes data is organized

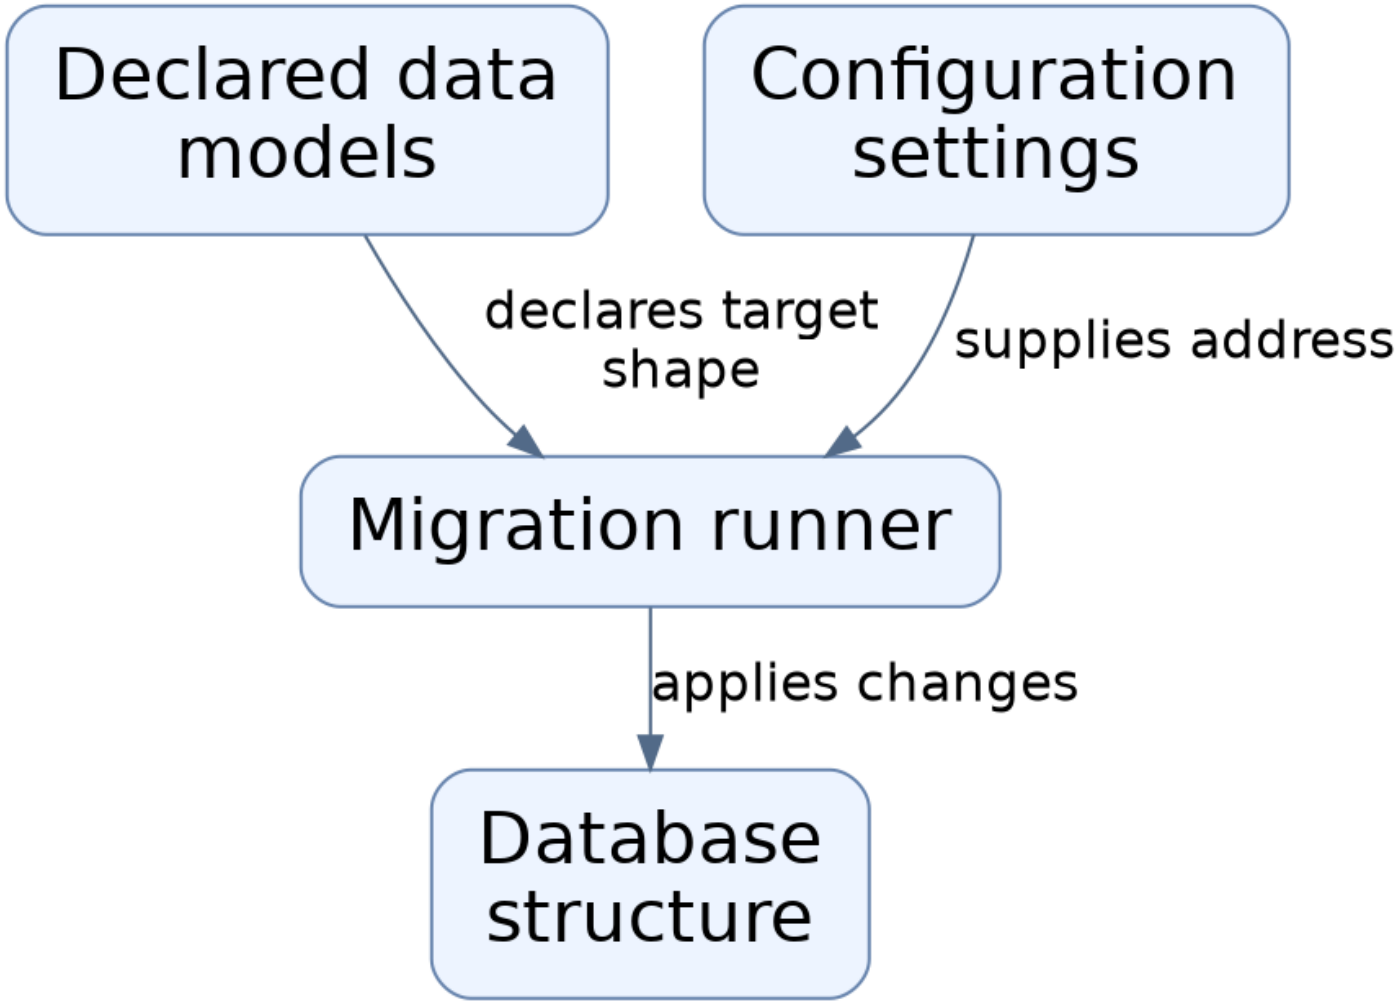

A meeting is the central record. Its recording, processing job, transcript pieces, and summary all belong to it, and removing the meeting removes them all.

How the database structure is kept in step

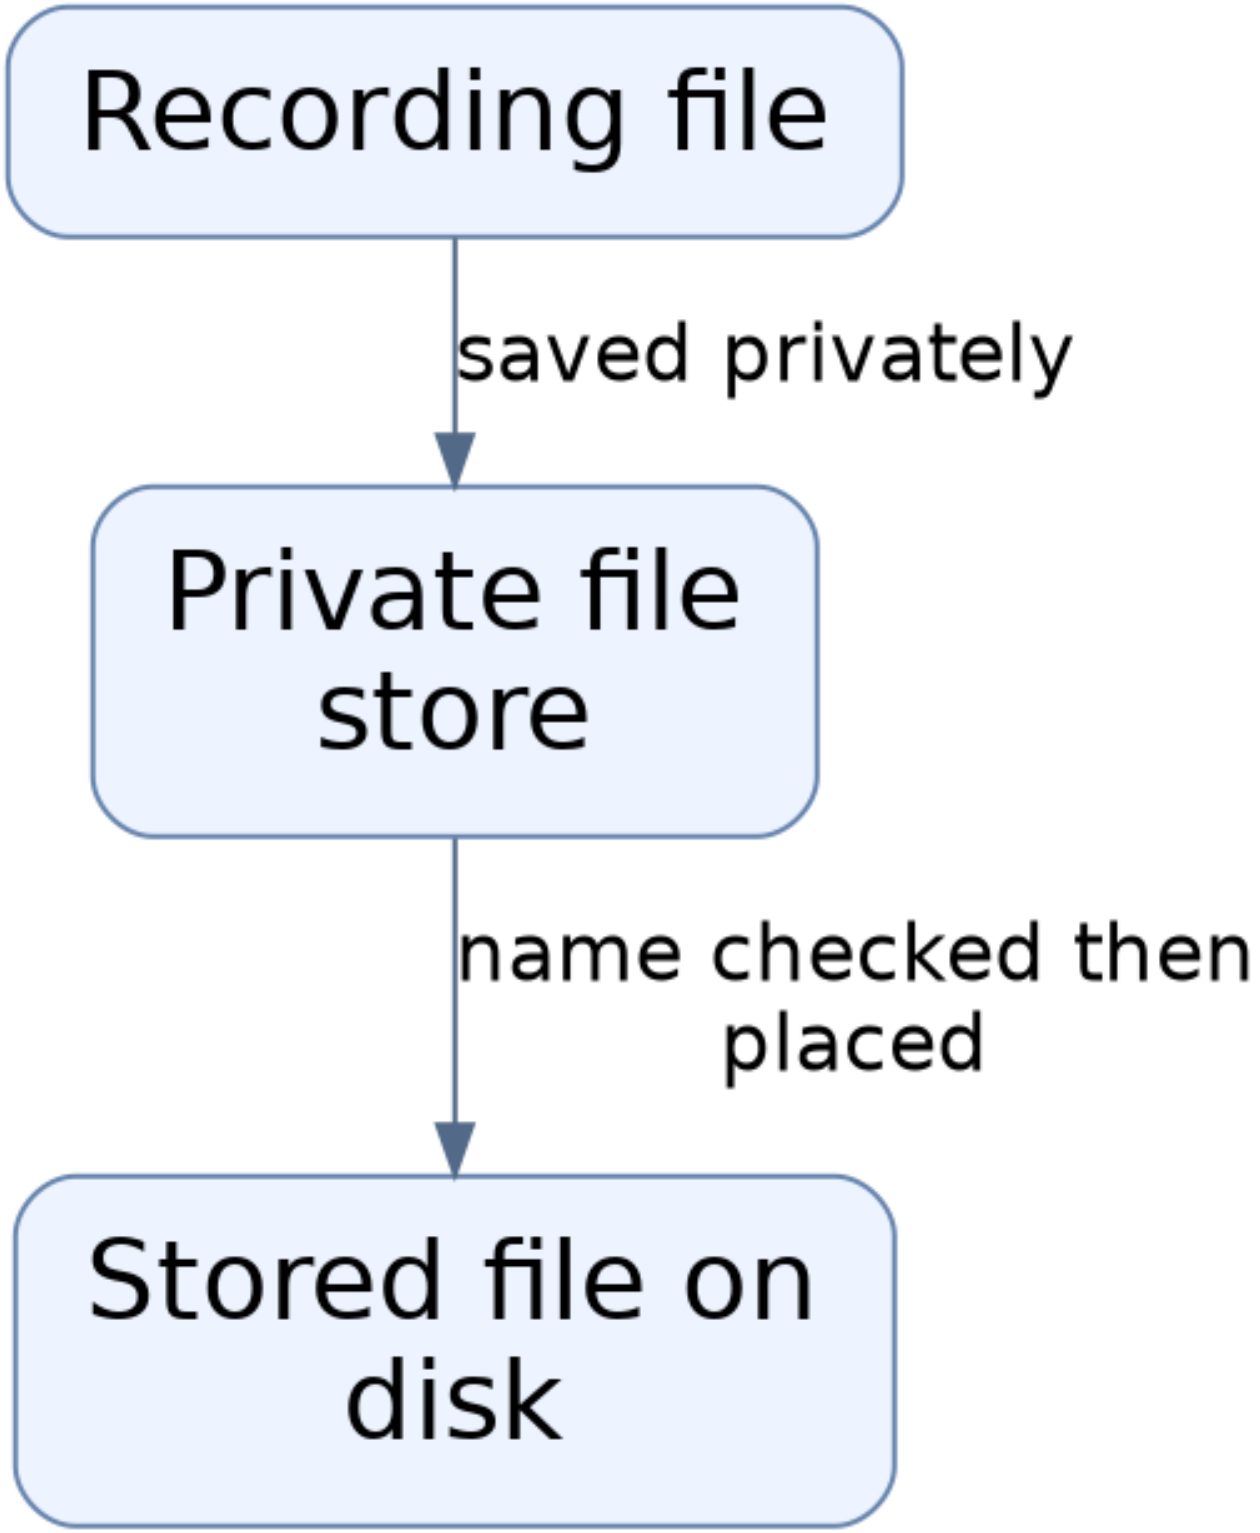

The migration tool reads the declared data models as its target shape and the configured database address, then either prints the SQL or applies it to a live database.

How recordings are kept privately on disk

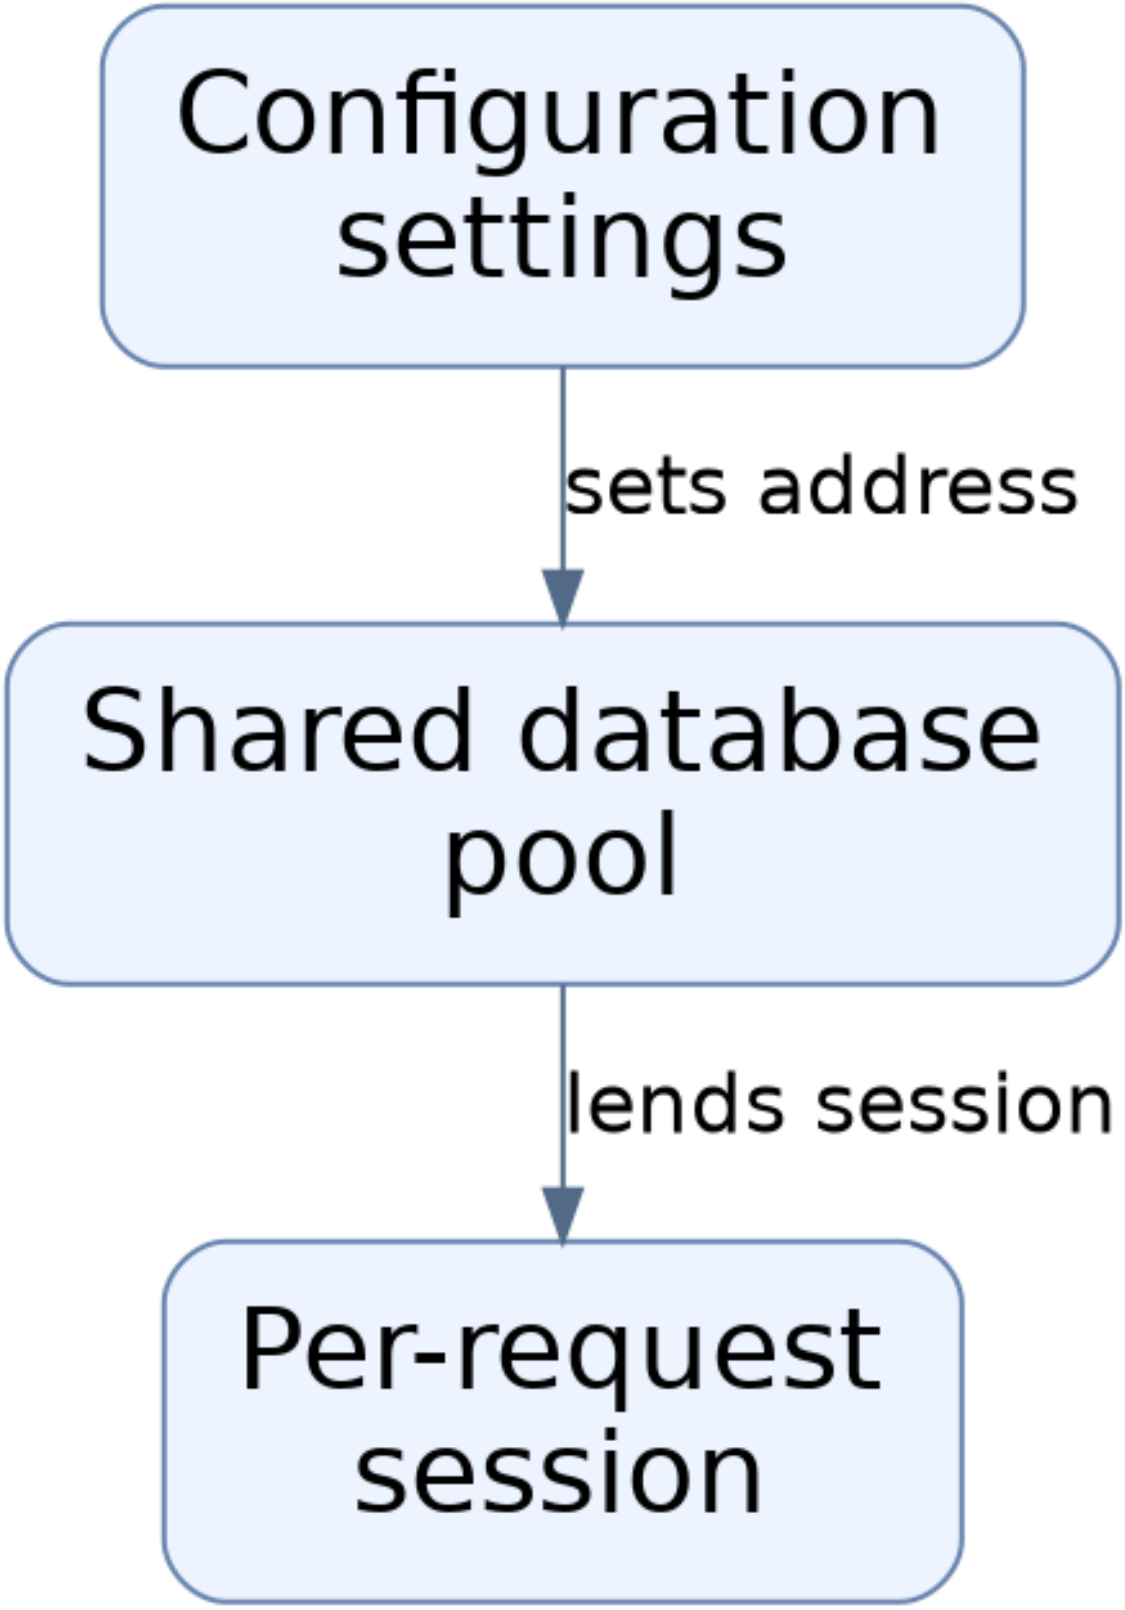

Recordings are saved as private files under one configured folder. Each file name must match a strict pattern, saving happens atomically, and reading or listing is offered for later use.

How database sessions reach request handlers

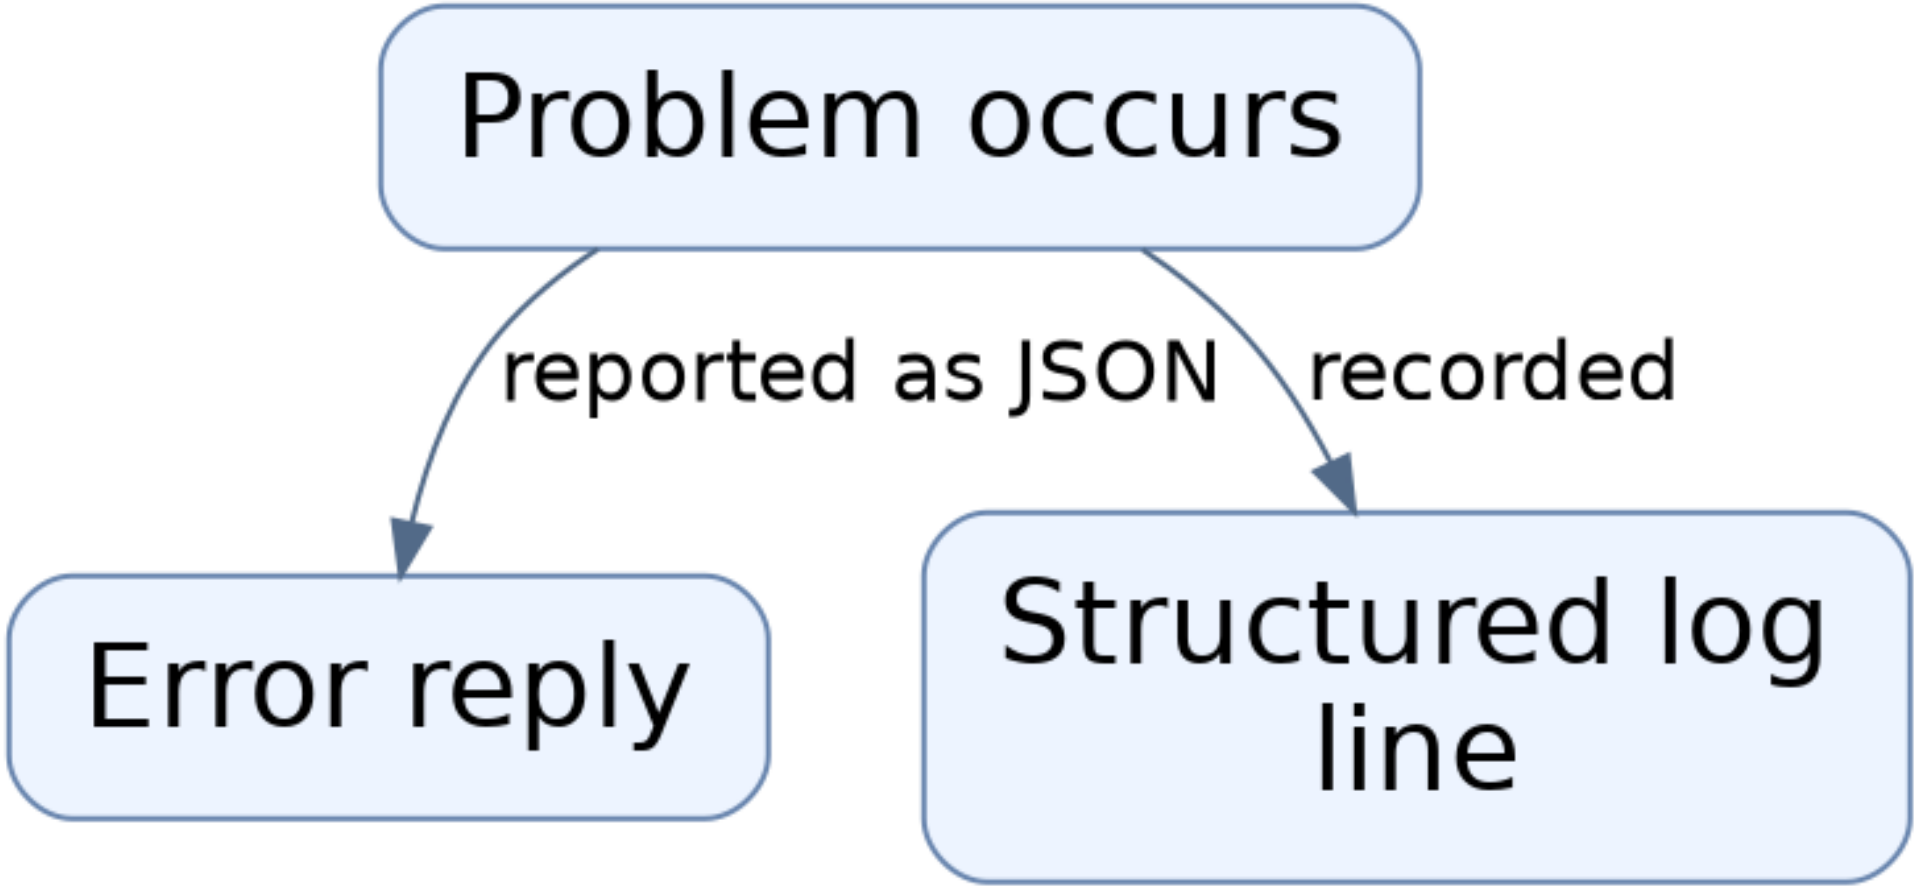

One shared connection pool is built from configuration, and each incoming request borrows a session and returns it when finished.

How failures are reported and logged

When something goes wrong, the service returns a small JSON error containing a code, message, and request reference. Logs are written as single-line JSON with only approved fields.
