meeting-api: How a recording becomes study notes (1/2)

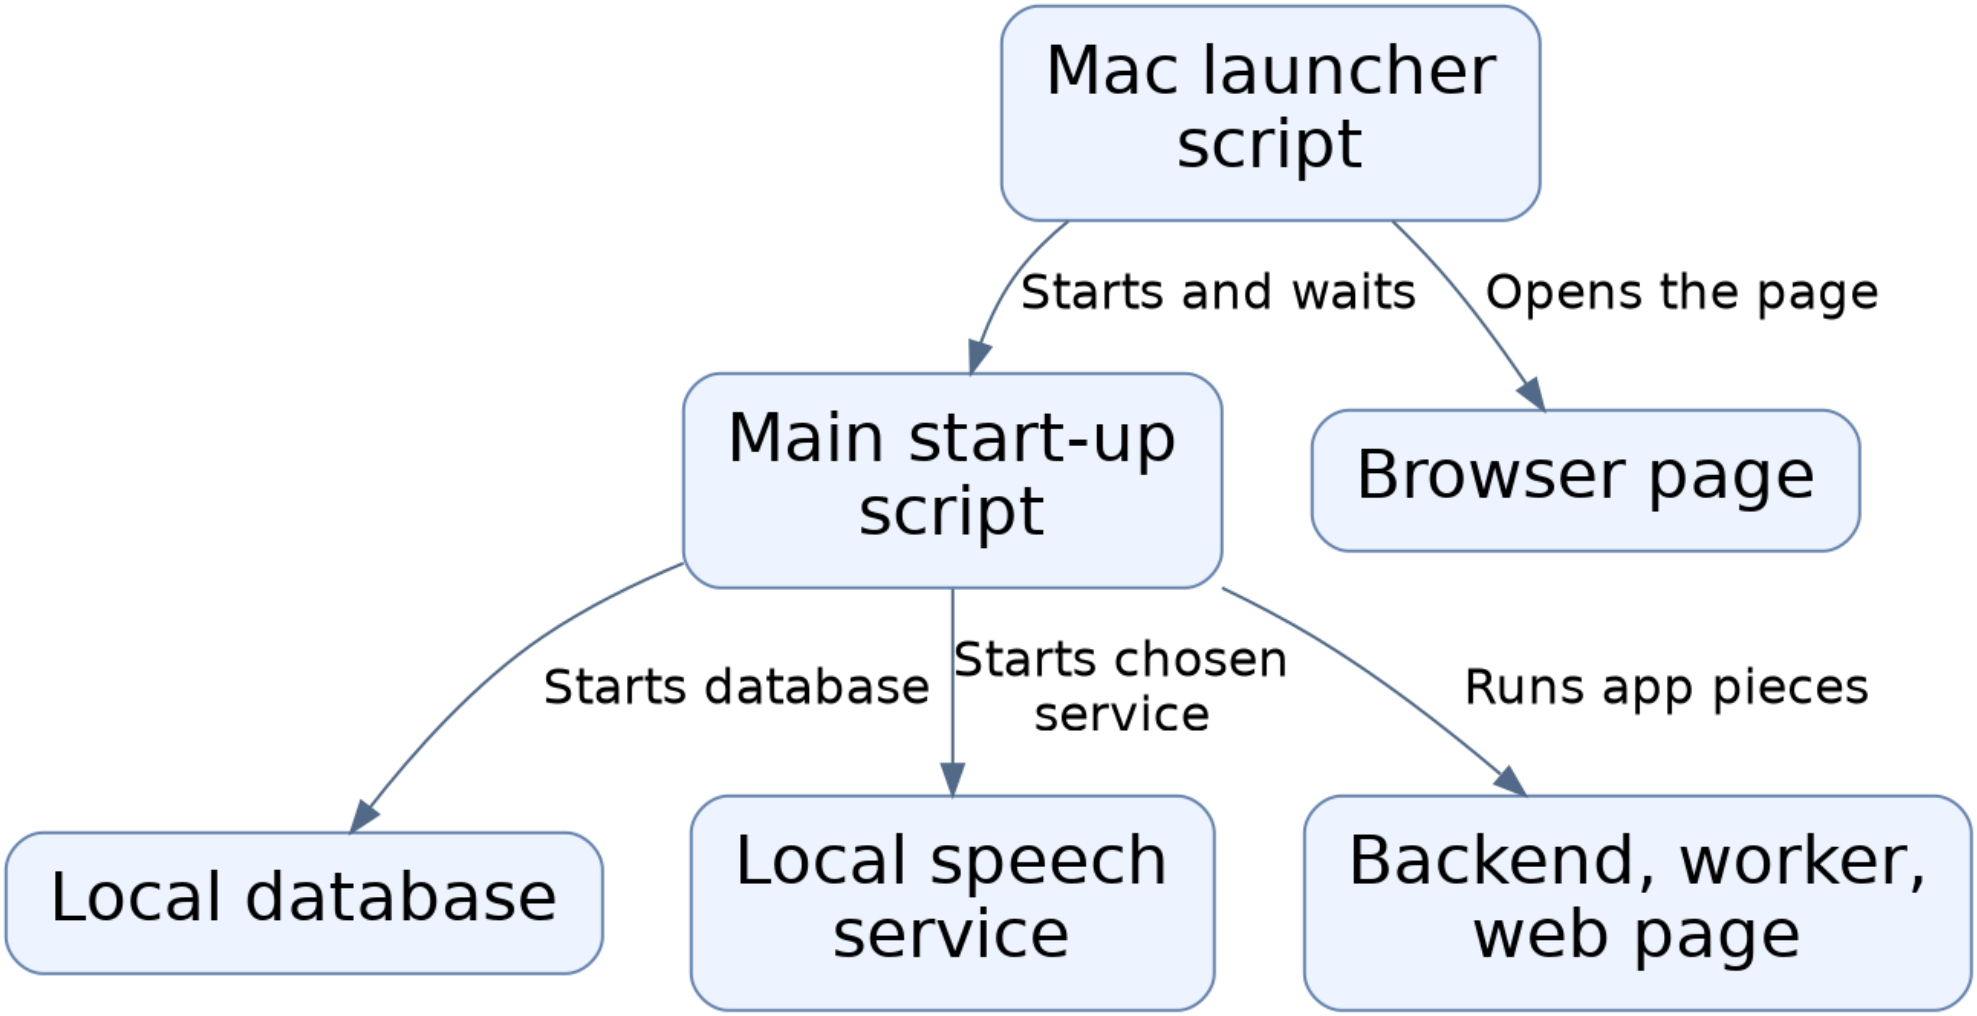

A local client asks the API to create a meeting and send audio; the system verifies the request is local, checks and stores the audio, queues a job, transcribes it, and builds structured study notes.

Read from top to bottom. Arrows show the direction of the interaction.

operations: How the app starts up

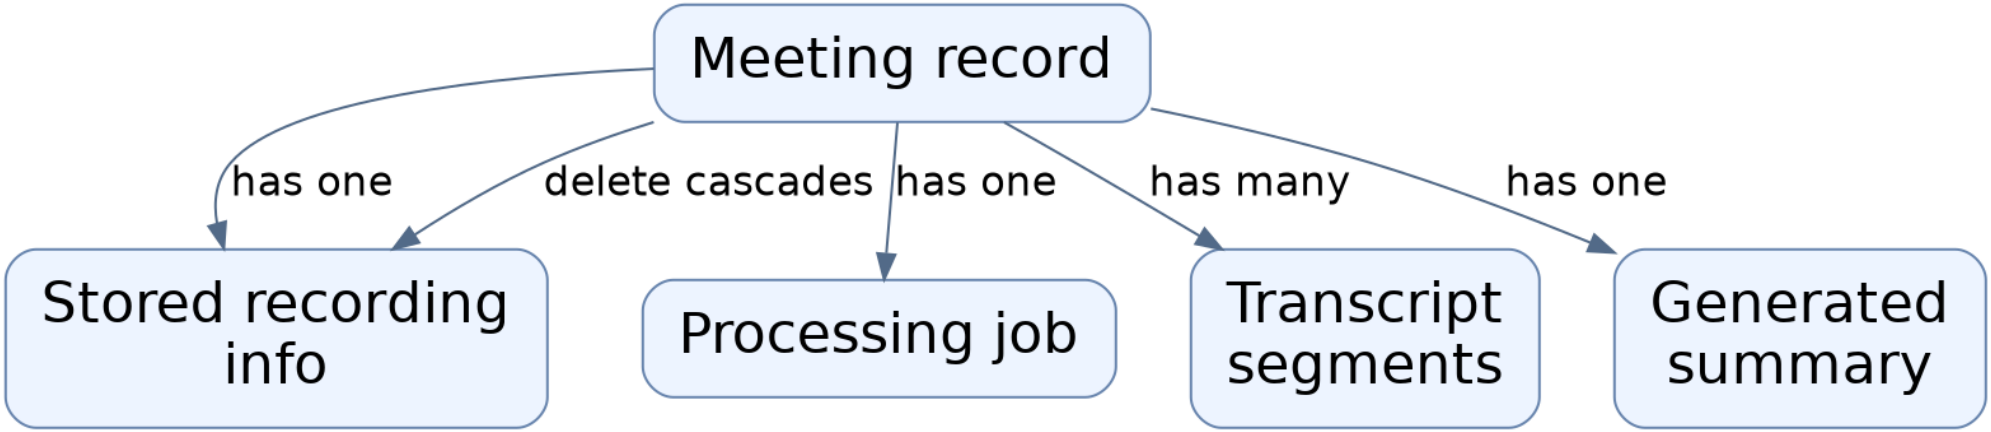

A person runs the Mac launcher, which starts the database, picks a local speech service, and brings up the app so the page opens in a browser.

Read from top to bottom. Arrows show the direction of the interaction.

persistence: How a meeting's notes data is organized

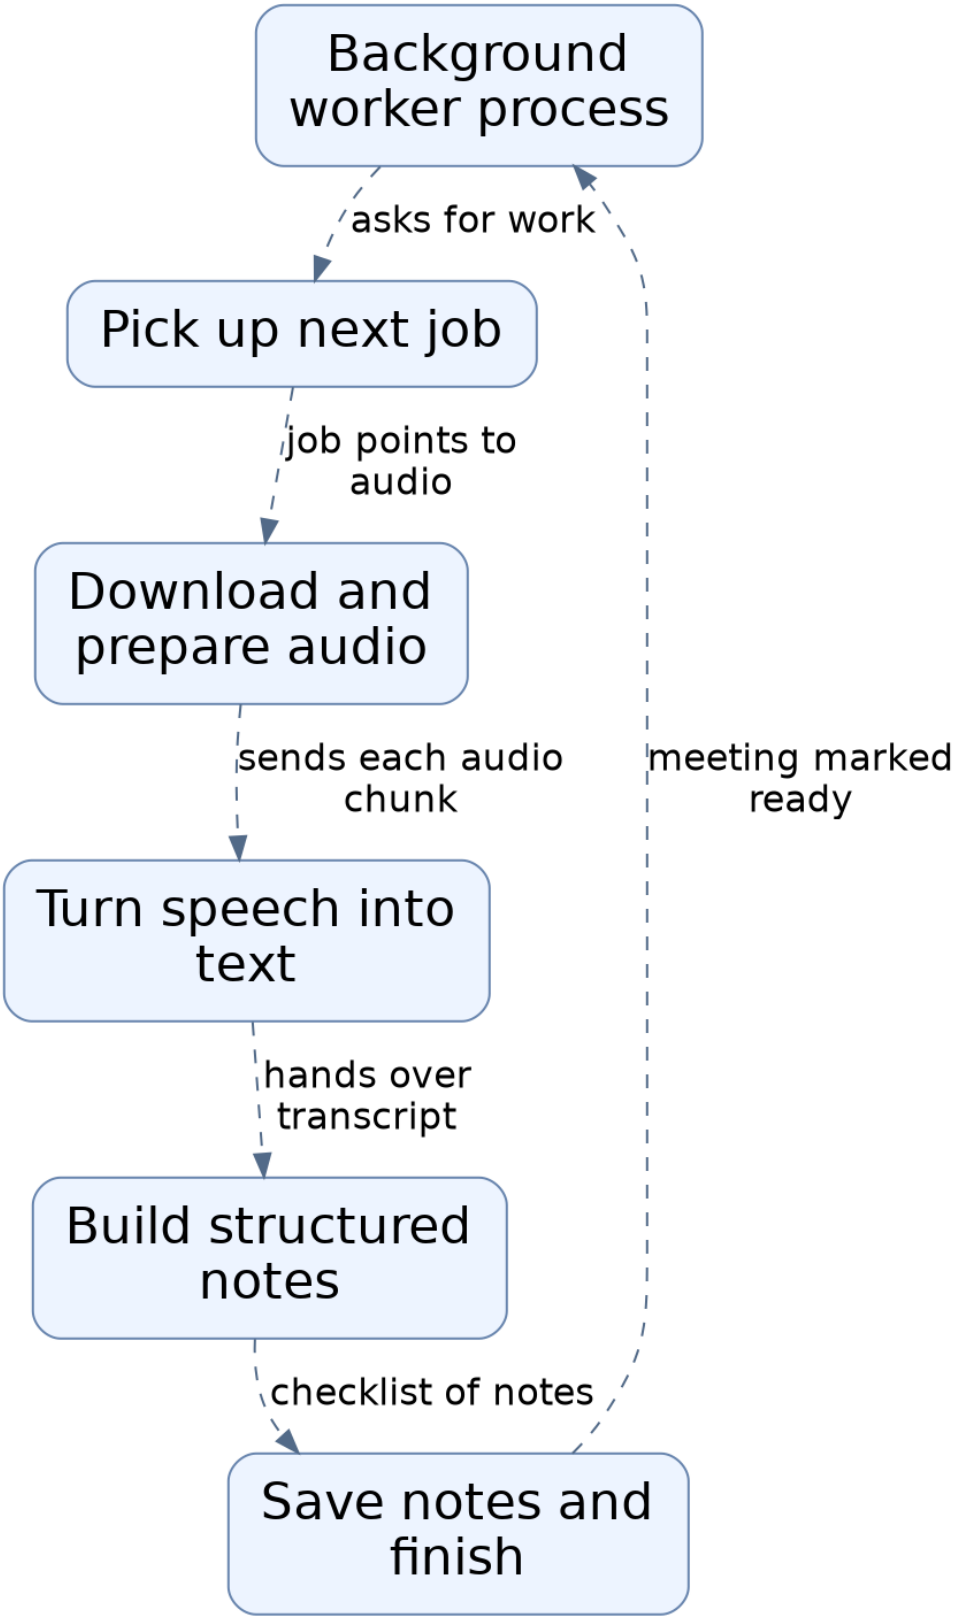

A meeting is the central record. Its recording, processing job, transcript pieces, and summary all belong to it, and removing the meeting removes them all.

Read from top to bottom. Arrows show the direction of the interaction.

processing: How a recording becomes meeting notes

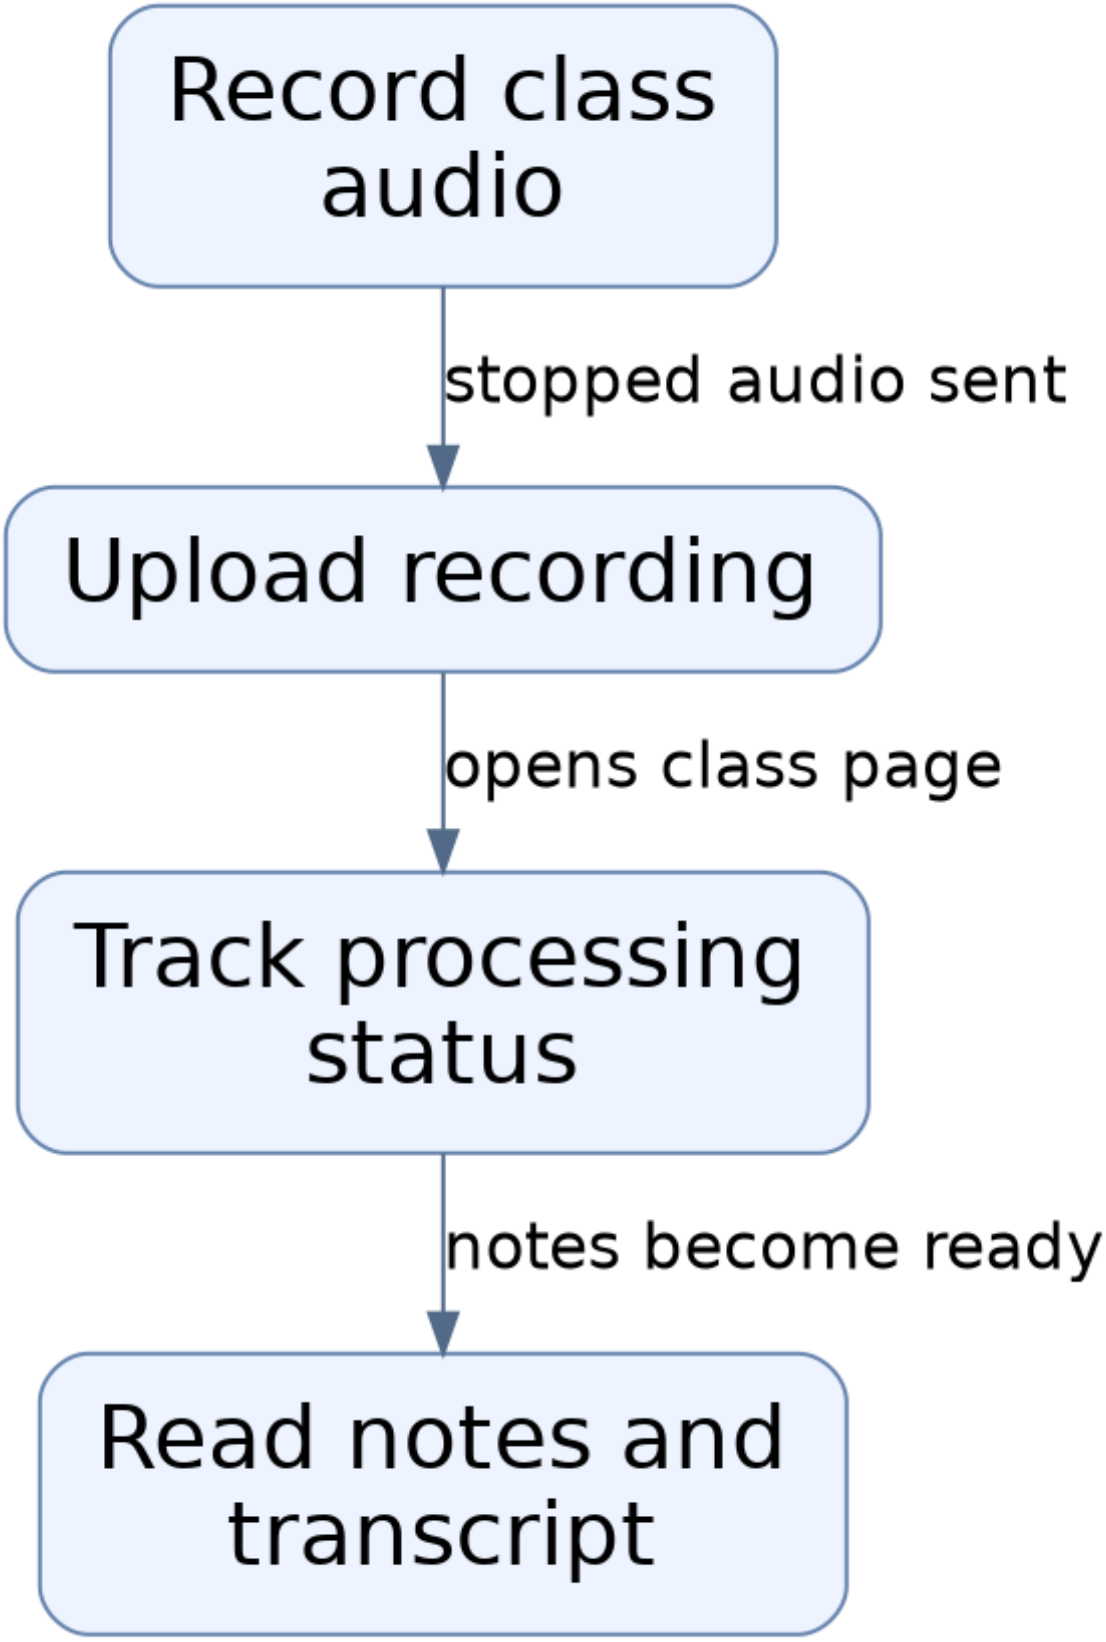

A background worker process loops continuously, claiming one queued job at a time, transcribing and then summarizing it, and saving the outcome.

Dashed arrows: connections that need confirmation.

web: How a class recording becomes study notes

You record audio in the browser; it is uploaded for processing; afterwards the page shows a transcript and AI-generated notes, refreshed automatically until ready.
